LLC "Ecobioprom"

Production of fuel pellets

The “wood fuel pellets” are the standardized cylindrical pressed product made out of dried wood, such as cutting wastes and sawdust remaining after the operation of chipper edges, lumps and refuses of wood.

The process of pellet forming is held under the pressure of approximately 300 atmospheres without any additives or glue. The length of pellets on the average is 10-30 mm, and the diameter is 8 mm.

LLC "Ecobioprom"

Our wood granule following the specification:

Diameter - 8 mm; Length - 15 mm ;

Material – pine (pinus sylvestris) ;
